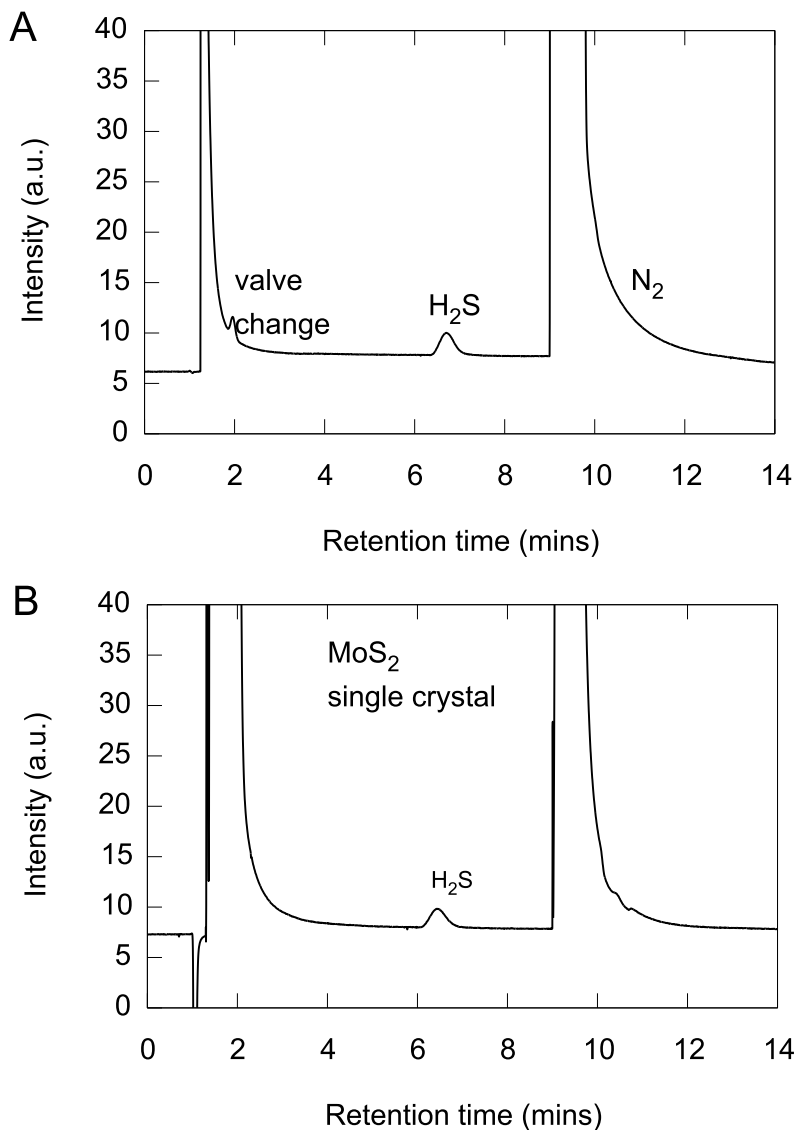

**Figure S1.** Photograph of a MoS<sub>2</sub> single crystal with electroplating tape applied to mask edge-dense areas (left) and an un-masked crystal with large amounts of edges (right).

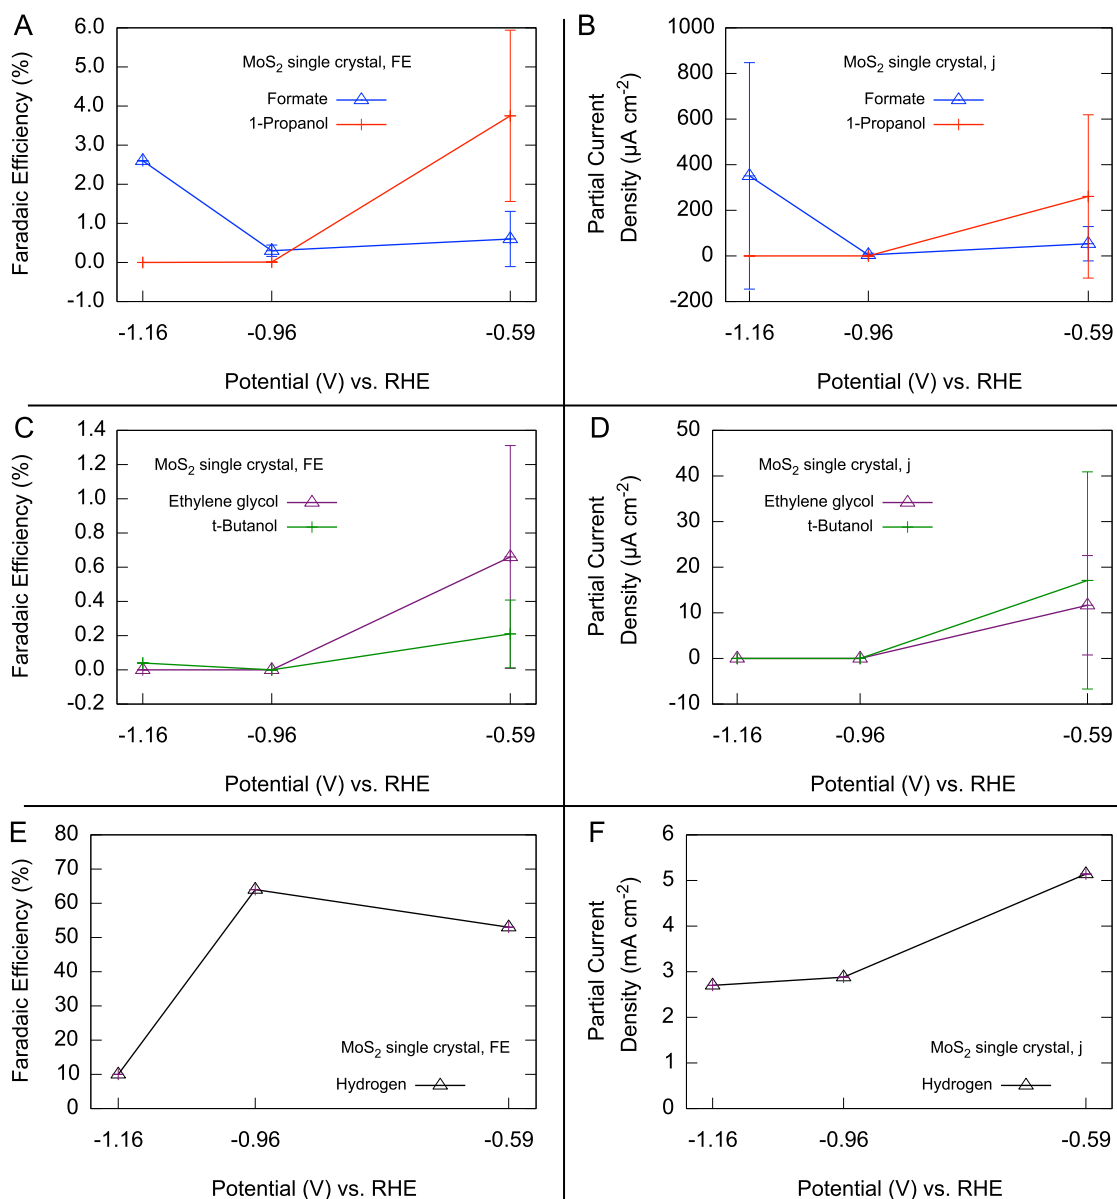

**Figure S2.** Representative GC-HS chromatograms of a liquid aliquot removed from the electrochemical cell after electrolysis at -0.59 V vs. RHE in 0.10 M Na<sub>2</sub>CO<sub>3</sub> acidified to pH 6.8 with 1 atm CO<sub>2</sub> on (top) MoS<sub>2</sub> single crystals and (center) 30-MoS<sub>2</sub> showing production of alcohols, compared to standard solutions (Bottom). Note that standards of acetone (not shown) have similar retention times to 2-propanol.

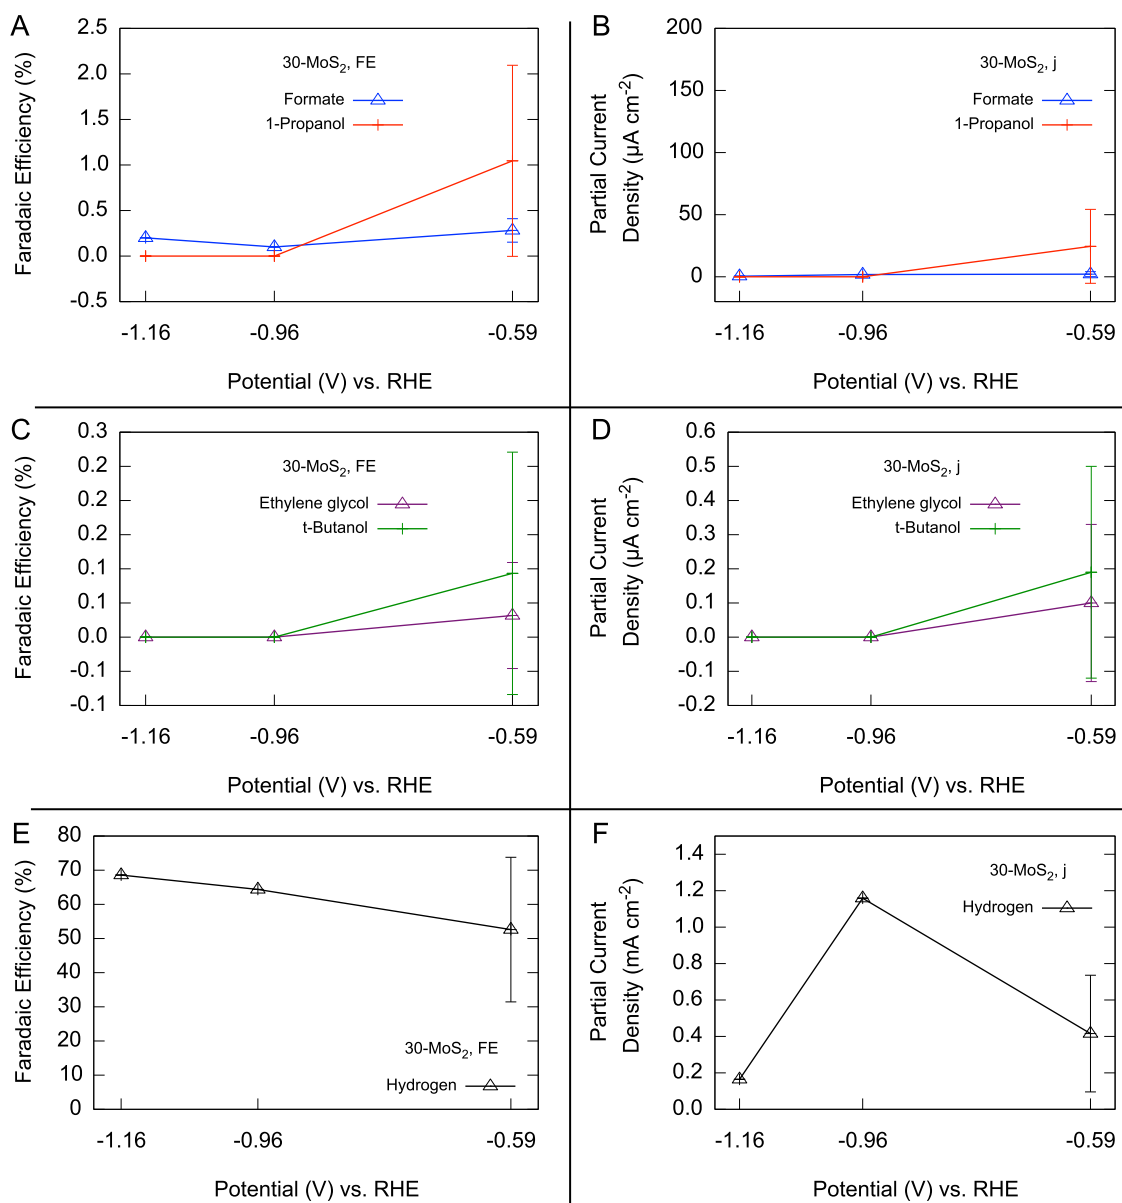

**Figure S3.** Representative NMR spectrum for electrolysis at -0.59 V vs. RHE for a single crystal of  $\text{MoS}_2$  in 0.10 M  $\text{Na}_2\text{CO}_3$  acidified to pH 6.8 with 1 atm  $\text{CO}_2$ . Peak chemical shifts are identified in Table S1.

**Figure S4.** Representative GC-TCD chromatograms showing the retention time for (A) a H<sub>2</sub>S standard made in situ from FeS and HCl in inert nitrogen atmosphere, and (B) H<sub>2</sub>S produced during bulk electrolysis in 0.10 M Na<sub>2</sub>CO<sub>3</sub> acidified to pH 6.8 with 1 atm CO<sub>2</sub> at -0.59 V vs. RHE at a MoS<sub>2</sub> single crystal terrace.

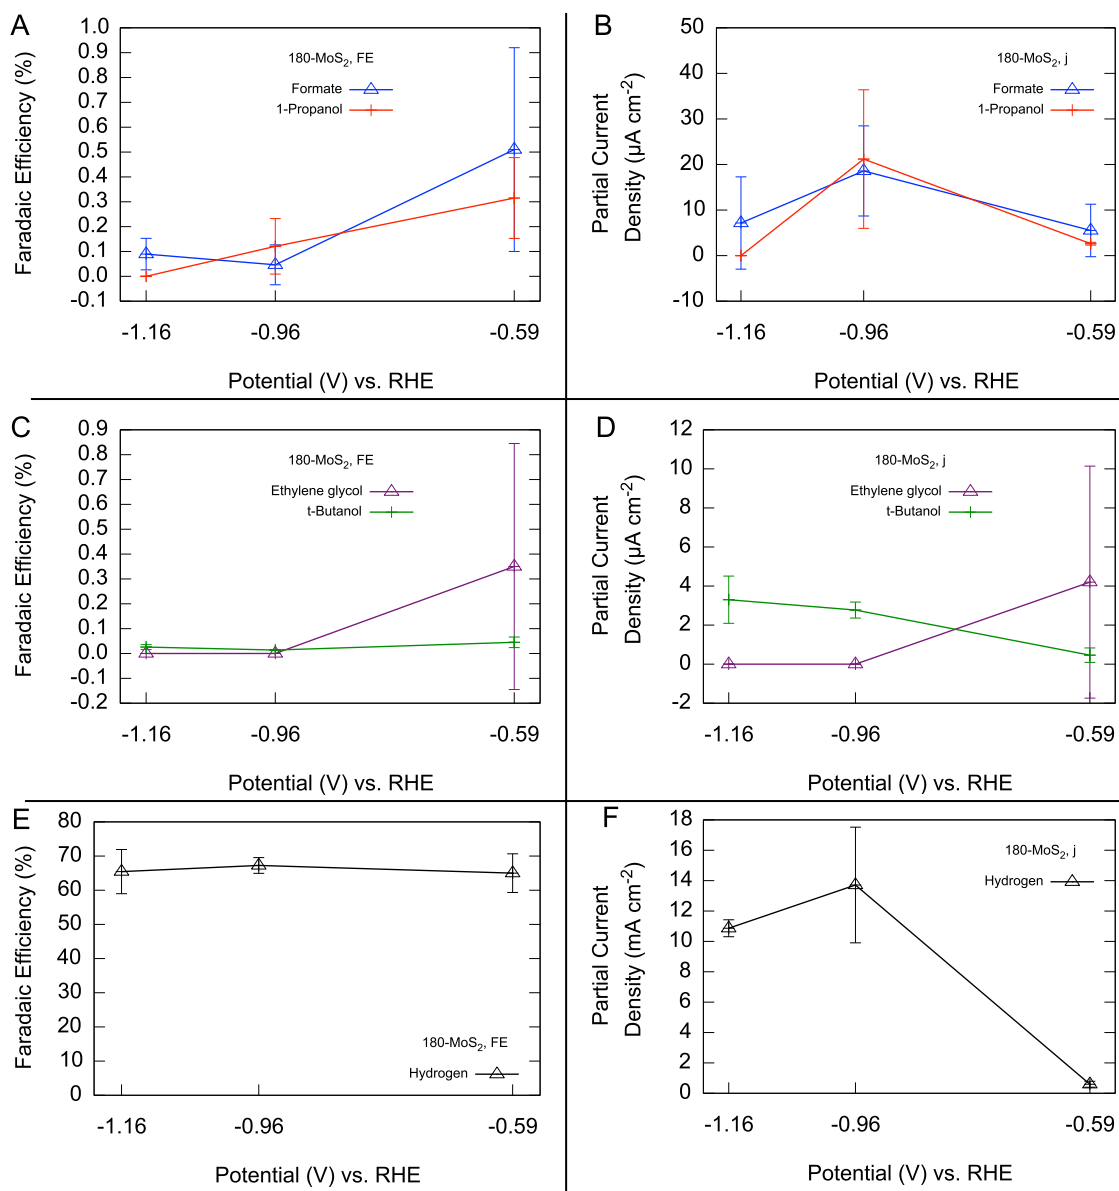

**Figure S5.** Potential-dependent Faradaic efficiencies (left) and partial current densities (right) for major (A,B), and minor CO<sub>2</sub>R products (C,D), and proton reduction (E,F) on MoS<sub>2</sub> single crystals with masked edge sites. The electrolyte was 0.10 M Na<sub>2</sub>CO<sub>3</sub> (aq) acidified to pH 6.8 with 1 atm CO<sub>2</sub>. Standard deviations are indicated for CO<sub>2</sub>R products.

**Figure S6.** Potential-dependent Faradaic efficiencies (left) and partial current densities (right) for major (A,B), and minor CO<sub>2</sub>R products (C,D), and proton reduction (E,F) on 30-MoS<sub>2</sub>. The electrolyte was 0.10 M Na<sub>2</sub>CO<sub>3</sub> (aq) acidified to pH 6.8 with 1 atm CO<sub>2</sub>. Standard deviations are indicated for products at the least reducing potential evaluated.

**Figure S7.** Potential-dependent Faradaic efficiencies (left) and partial current densities (right) for major (A,B), and minor CO<sub>2</sub>R products (C,D), and proton reduction (E,F) on 180-MoS<sub>2</sub>. The electrolyte was 0.10 M Na<sub>2</sub>CO<sub>3</sub> (aq) acidified to pH 6.8 with 1 atm CO<sub>2</sub>. Standard deviations are indicated for products.

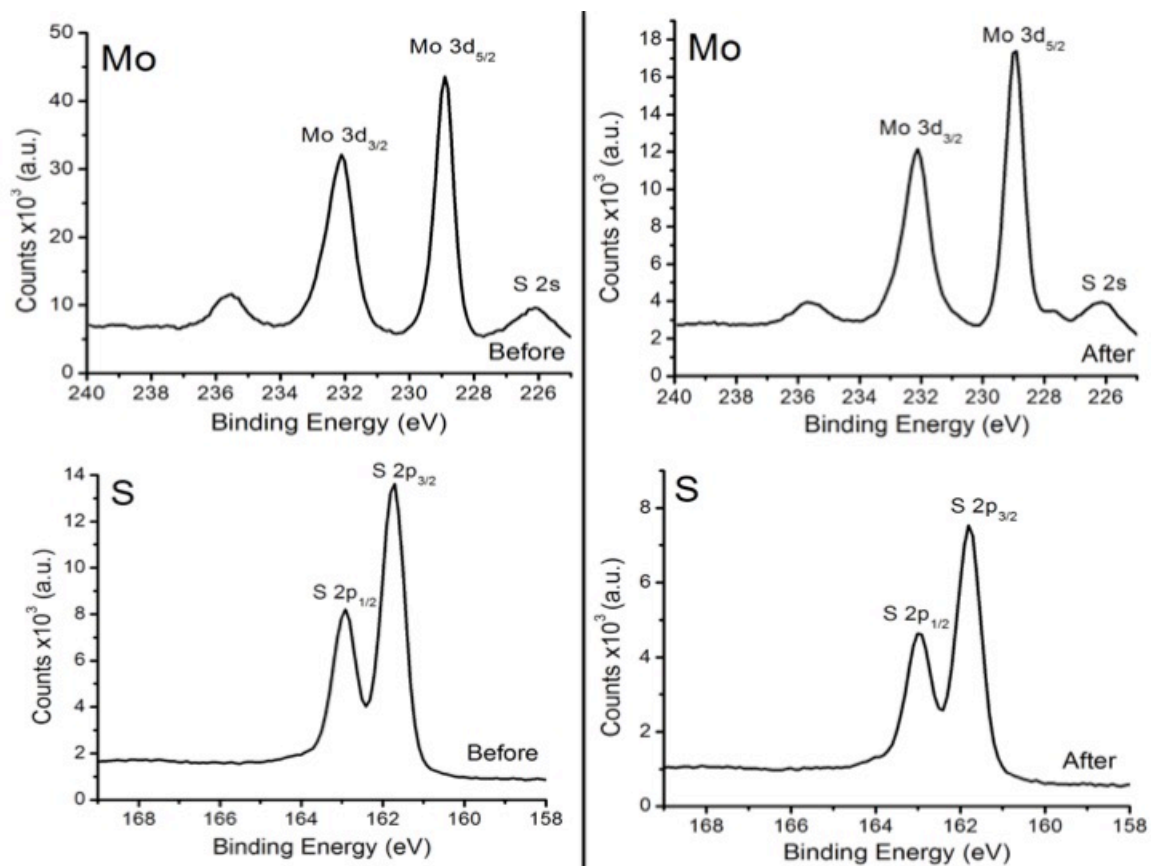

**Figure S8.** Representative NMR spectra in the 6H,s t-butanol region showing (A) t-butanol produced during unlabelled CO<sub>2</sub>R on MoS<sub>2</sub> single crystal terraces, (B) labelled t-butanol production from <sup>13</sup>CO<sub>2</sub>R on MoS<sub>2</sub> single crystal terraces. Electrolyses were performed at -0.59V vs. RHE in 0.1 M Na<sub>2</sub>CO<sub>3</sub> electrolyte acidified to pH 6.8 with 1 atm of reactant gas.

**Figure S9.** Representative chromatogram for the GC-MS analysis of gas products from CO reduction on a MoS<sub>2</sub> terrace. Electrolysis was performed at -0.59 V vs. RHE in 0.10 M K<sub>2</sub>HPO<sub>4</sub> (aq) buffered to pH 6.8 with KH<sub>2</sub>PO<sub>4</sub> (aq) and purged with CO(g). The total charge passed was 60 Coulombs.

**Figure S10.** Representative chromatogram for the GC-MS analysis of gaseous products from CH<sub>4</sub> reduction on a MoS<sub>2</sub> terrace. Electrolysis was performed at -0.59 V vs. RHE in 0.10 M K<sub>2</sub>HPO<sub>4</sub>(aq) buffered to pH 6.8 with KH<sub>2</sub>PO<sub>4</sub>(aq) and purged with CH<sub>4</sub> gas. The total charge passed was 60 Coulombs.

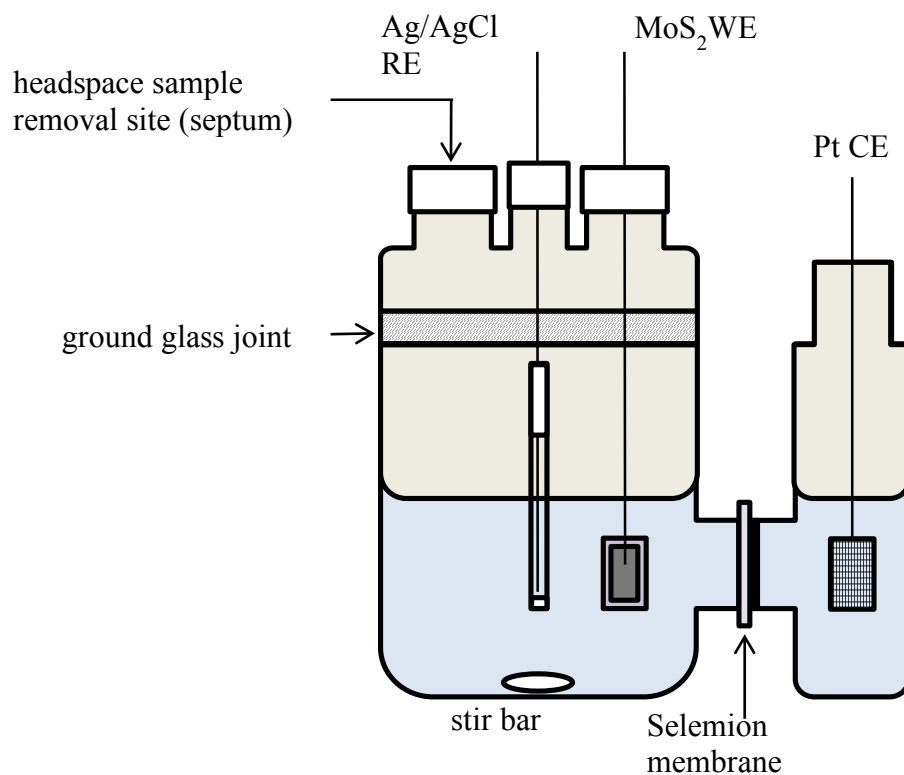

**Figure S11.** X-ray photoelectron spectroscopy of single crystals of MoS<sub>2</sub> before and after CO<sub>2</sub>R, respectively.

**Figure S12.** Scanning tunneling microscopy images showing sulfur vacancies on terraces of MoS<sub>2</sub> single crystals. The gap voltage was set to 1.3V, the tunneling current to 0.69 nA, the scan rate to 434 nm/s (forward scan direction (left to right))

**Figure S13.** Open circuit voltages and GC-FID data for bulk single crystal MoS<sub>2</sub> in 0.1 M Na<sub>2</sub>CO<sub>3</sub> solution purged with high purity CO<sub>2</sub> for one hour with no applied voltage. (A) Measured open circuit voltage vs. time. (B) . GC-FID data of two data sets. The orange chromatogram (top) shows a 16.5 hour run with background subtraction resulting in no prominent peaks of interest. The peaks at 6 and 7 minutes are caused by water vapor interacting with the column. The black chromatogram (bottom) shows 1  $\mu$ M calibration solutions of methanol, ethanol, acetone, and 1-propanol. Chromatograms demonstrate that no key alcohol products derived from CO<sub>2</sub> reduction were formed when no current was being applied.

**Figure S14.** Schematic of the sealed custom H-cell used for the electrochemical experiments.

**Figure S15.** NMR spectrum showing chemical shifts of standards ~0.002 vol % in 0.10 M Na<sub>2</sub>CO<sub>3</sub> (aq). Dimethyl formamide (DMF) was used as the internal standard, with the aldehydic proton signal at 7.92 ppm used to calibrate the chemical shift positions. Peak chemical shifts are identified in Table S1.

Standard name	Resonant $^1\text{H}$ (in bold)	Chemical shift, $\delta$ (ppm)	Splitting
formate	<b>H</b> COO <sup>-</sup>	8.44	1H,s
dimethylformamide <sup>a</sup>	(CH <sub>3</sub> ) <sub>2</sub> NC(O)H	7.92	1H,s
	( <b>CH</b> <sub>3</sub> ) <sub>2</sub> NC(O)H	3.00	3H,s
	(CH <sub>3</sub> ) <sub>2</sub> N <b>C</b> (O)H	2.85	3H,s
2-propanol	CH <sub>3</sub> CH(OH)CH <sub>3</sub>	4.01	1H,m
	<b>CH</b> <sub>3</sub> CH(OH) <b>CH</b> <sub>3</sub>	1.16	6H,d
ethylene glycol	HO <b>CH</b> <sub>2</sub> <b>CH</b> <sub>2</sub> OH	3.66	4H,s
ethanol	CH <sub>3</sub> <b>CH</b> <sub>2</sub> OH	3.64	2H,q
	<b>CH</b> <sub>3</sub> CH <sub>2</sub> OH	1.17	3H,t
1-propanol	CH <sub>3</sub> CH <sub>2</sub> <b>CH</b> <sub>2</sub> OH	3.55	2H,t
	CH <sub>3</sub> <b>CH</b> <sub>2</sub> CH <sub>2</sub> OH	1.53	2H,sex
	<b>CH</b> <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> OH	0.88	3H,t
methanol	<b>CH</b> <sub>3</sub> OH	3.34	3H,s
acetone	<b>CH</b> <sub>3</sub> (O) <b>CH</b> <sub>3</sub>	2.20	6H,s
acetate	<b>CH</b> <sub>3</sub> COO <sup>-</sup>	1.90	3H,s
<i>t</i> -butanol <sup>b</sup>	( <b>CH</b> <sub>3</sub> ) <sub>3</sub> COH	1.23	6H,s
methane	<b>CH</b> <sub>4</sub>	0.16	4H,s

**Table S1.** Chemical shifts of NMR peaks used for analysis of products and reactants relevant to CO<sub>2</sub>R observed in this work.<sup>a</sup> Internal standard; <sup>b</sup> At < 1  $\mu\text{M}$  *t*-butanol, a broad shoulder at 1.27 ppm was visible with the main singlet.
